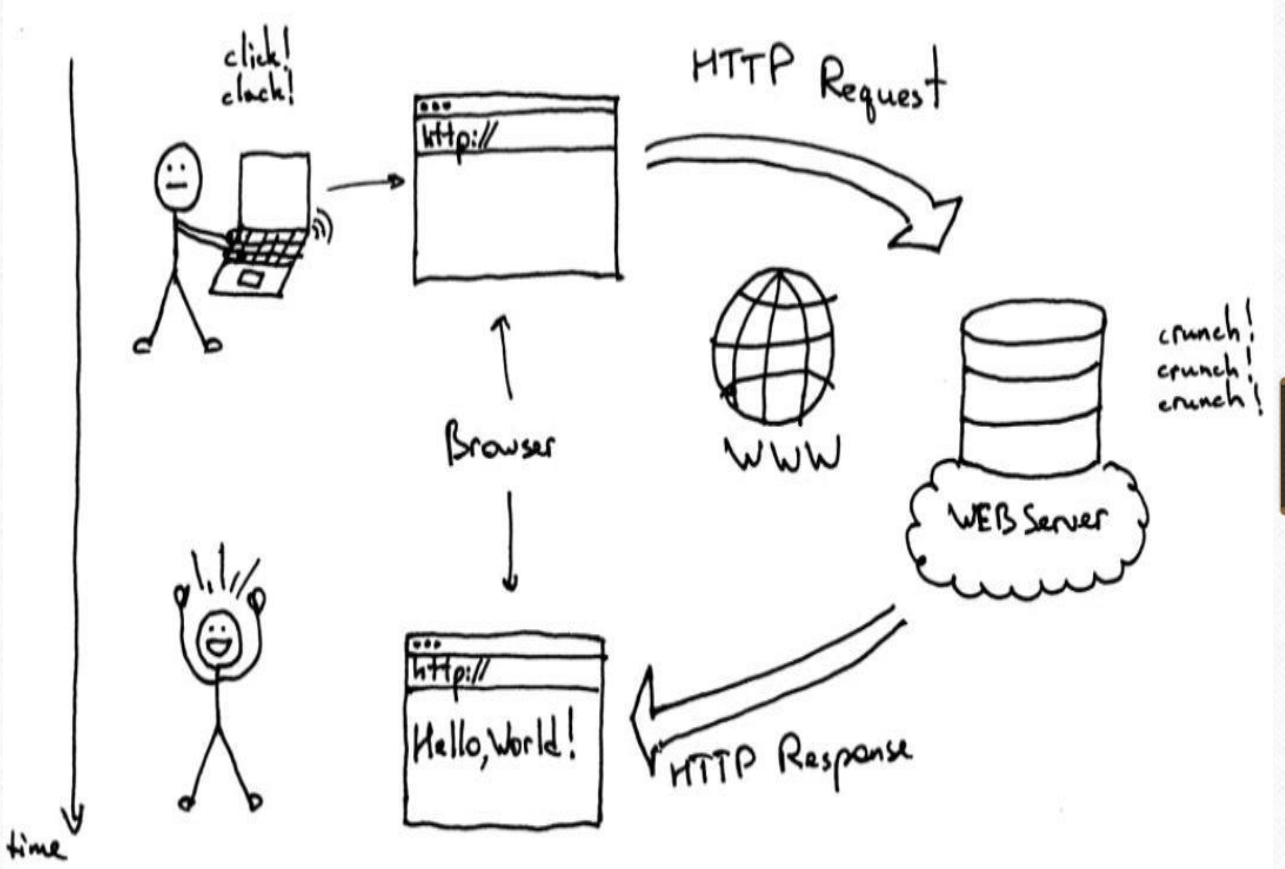
HTTP
HYPER TEXT TRANSFER PROTOCOL

Definition:

HTTP is a communication protocol used to transfer data between a web browser (client) and a web server on the Internet.



History:

Inventor: Tim Berners-Lee
Year: 1989–1990
Place: CERN (a research center in Switzerland)

HTTP 0.9 (1990): Simple version, only sent HTML pages.
HTTP 1.0 (1996): Added headers and multimedia support.
HTTP 1.1 (1999): Faster — used persistent connections and caching.
HTTP/2 (2015): Binary format, multiplexing for better speed.
HTTP/3 (2022): Uses QUIC, faster and more secure.

Advantages of HTTP

* Easy to use
* Fast communication
* Platform independent
* Supports caching (loads pages faster)
* Works without keeping connection always on

Disadvantages of HTTP

* Not secure (data not encrypted)
* Server doesn't remember users (stateless)
* Uses more data and bandwidth
* Data can be hacked or changed easily

THANK YOU
